                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Index vector: pME18S-FL3; Site_1: Drail (CACTGTGTG);
Site_2: Drail (CACCATCTG); 1st strand cDNA was primed
with an oligo(dT) primer [ATGTGGCCTTTTTTTTTTTTTT];
double-stranded cDNA was igated to a Drail adaptor
[TGTTGGCCTACTGG], digested and cloned into distinct Drail
sites of the pME18S-FL3 vector (5' site CACTGTGTG, 3' site
CACCATGTG). XhoI should be used to isolate the cDNA
insert. Size selection was performed to exclude fragments
<1.5kb. Library constructed by Dr. Sumio Sugano
'(University of Tokyo Institute of Medical Science).

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo."

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1057416-1061255, and 1144584-1143551).

    Pred. No. 1s the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Claim 2; Page 21-22; 35pp; English.
```

The present sequence encodes a human vitamin D receptor related (VDRR) CC polypeptide. Human VDRR polypeptides and substances which affect VDRR CC signal transduction, can be used for treating metabolic, proliferative or inflammatory conditions. They can be used in the manufacture of a CC medicament for treating the following conditions: obesity, diabetes, CC ancrexia, lipoprotein defects, hyperlipidaemia, hypercholesterolaemia or CC hyperlipoproteinaemia and osteoporosis, rheumatoid arthritis, benign and CC malign tumours, hyperproliferative skin disorders or hyperthyroidism. CC Nucleic acid vectors encoding for expression of a VDRR polypeptide can CC be used for treating metabolic, proliferative or inflammatory conditions, CC by introducing them into a mammal. The introduced nucleic acid is then CC capable of transforming a cell in vivo and then polypeptide is expressed. A substance affecting VDRR signal transduction, such as an agonist or CC antagonist can be used for the manufacture of a medicament for treating CC metabolic, proliferative or inflammatory condition.

CC N.B. The specification specifically claims the VDRR nucleic acid and CC polypeptide sequences given in figures 1, 4, 7 and 8, but no figures are given in the specification.

This invention describes the isolation of the novel human nuclear receptors nNR7 or nNR7-1. The nNR7 and nNR7-1 proteins are useful in the identification of downstream target genes and ilgands regulating its activity. The nuclear receptor is involved in the regulation of in vivo cell proliferation and/or cell development. The nNR7 and nNR7-1 polynucleotides, expression vectors and host cells are useful for the recombinant production of the protein.
                                                                                                                                             WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               treatment;
                                                                                                                                                                             The present sequence encodes a human intranuclear receptor protein. The nucleic acid sequence was isolated from a human adult cDNA library using a swellfish ANO23 derived probe. The protein can be used for the development of drugs and diagnosis and treatment
